Set Up

Install Google Chrome

If you aren't already using Google Chrome, please install it at https://www.google.com/chrome/dr/download/. The rest of the steps should be done on Chrome.

Log into Github

Please make sure you are logged into Github from your computer. You will navigate to these two links to two Github repository branches from where you will work on your two tasks:

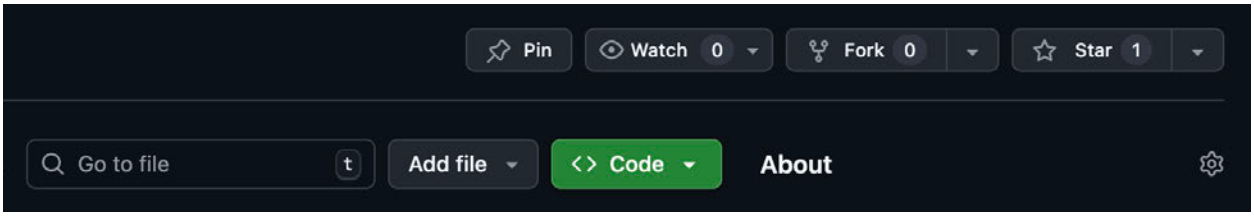

[redacted]

[redacted]

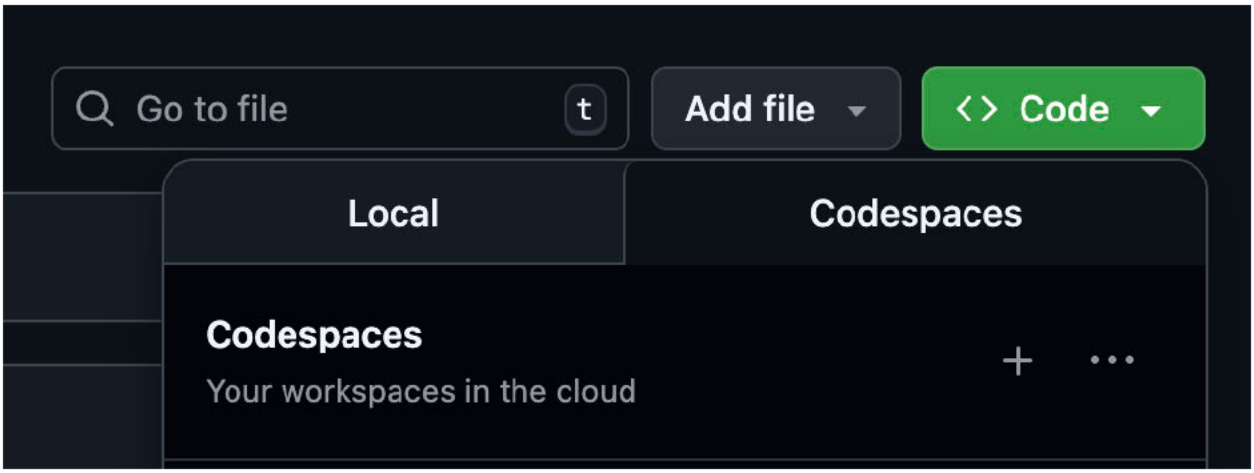

Since the Codespace set up script takes several minutes to run, you will follow the steps below for ***both*** links so that they are set up in parallel to save time.

Open a Dev Environment with Codespace

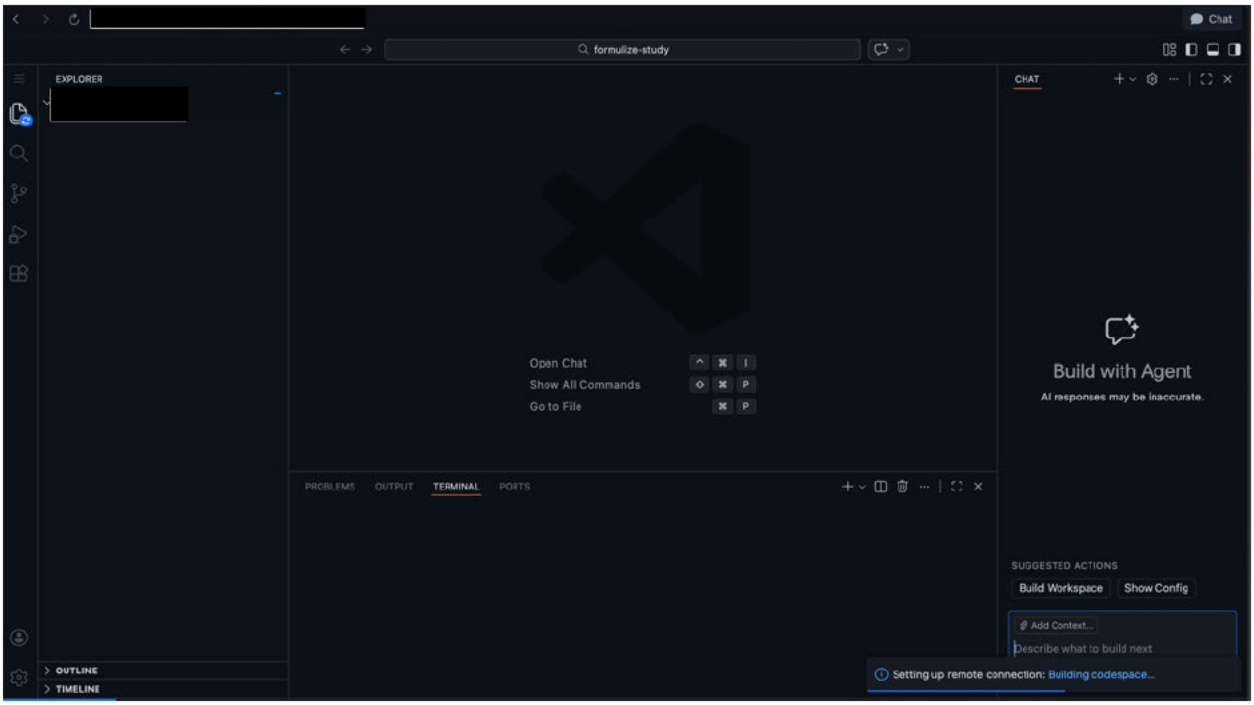

1. **Click the green `Code` button on the repository**

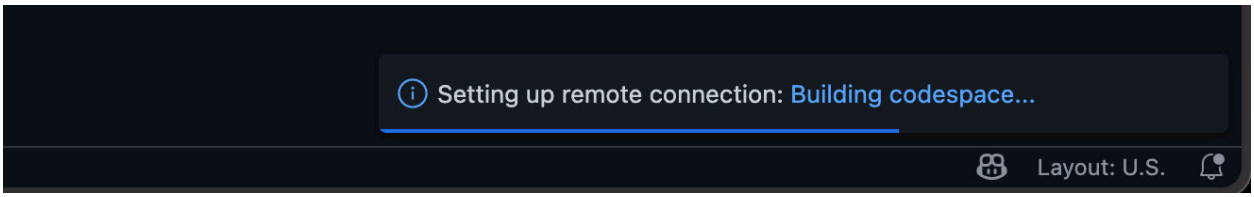

2. **Select the `Codespaces` tab**

3. **Click the + icon button**. Codespaces will launch a new window, where it will set up a development environment and install all dependencies. This may take 1-2 minutes.

2. Let the set up run until completion.

Running the App

Once your Codespace is ready (you may ask to confirm), open the terminal and run:

```
npm run dev
```

Viewing the App

When the server starts, Codespaces will detect the port and show a **popup notification** in the bottom-right corner. Click `Open in Browser` to view your app. Alternatively, click the `Ports` tab at the bottom of the editor to see all forwarded ports and their URLs.
