Task

In this task, you will make modifications to an interactive formula to match a reference we provide. The starter code produces this formula:

This is an interactive rendering of a formula representing the calculation of kinetic energy of an object based on its mass and velocity. `K` and `v` are interactive: as a user drags `v`, the value of `K` changes.

Task: Make `m` interactive similar to `v`. Users should be able to drag it to change its value, and see the value of `K` update. This demo shows what your result should look like:

More concretely, your implementation must hit these **requirements**:

1. There is a label for `m` that displays its value and description "**Mass**".
2. Upon initial render, `m` should be assumed to have a value of `1`.
3. `m` is draggable:
    - It can take on the values between `0` to `10`
    - The value should change by increments of `1`

- It should be draggable both...
  - By dragging the `m` in the formula
  - By dragging the value in the label

4. The value for variable K should be calculated correctly based on the values of "m" and "v"
   - For instance, with `m = 10` and `v = 10`, then `K = 500`.

Timing: You have **20 minutes** to complete this task. If you think you are done, tell us "I am done." We will check you work and allow you to move on if you are finished.
