Set Up

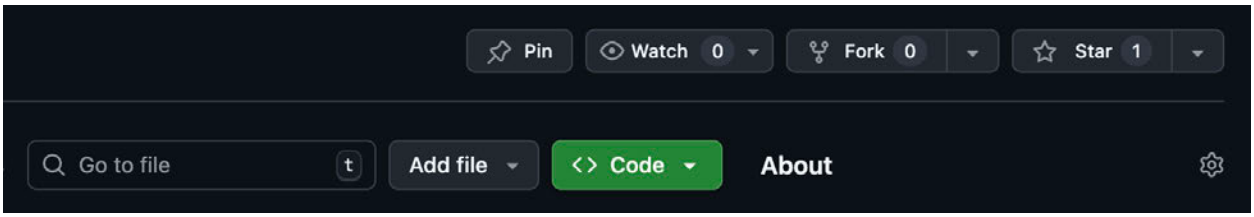

Log into Github

Please make sure you are logged into Github from your computer. You will navigate to this link to a Github repository branch from where you will work on your task:

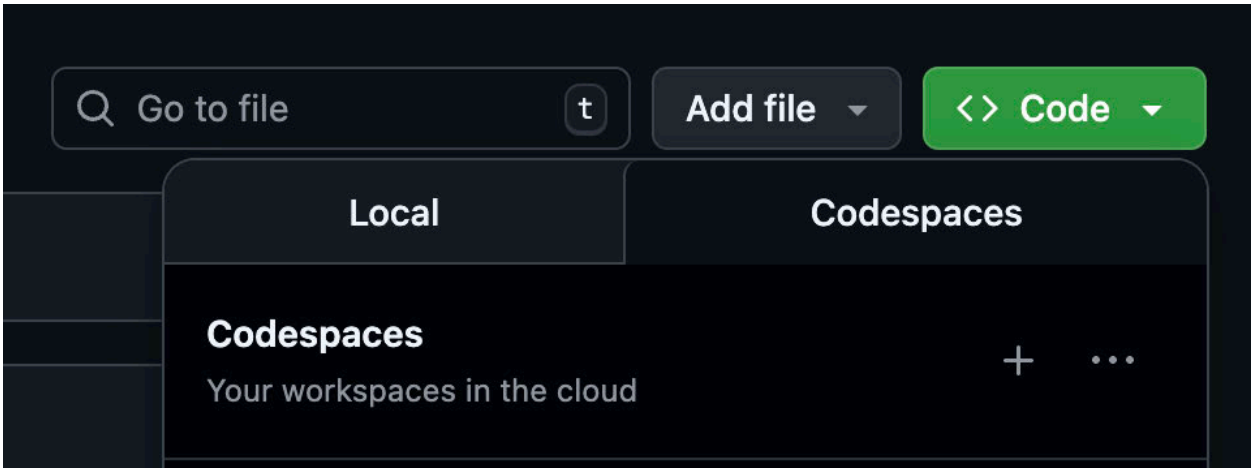

[redacted]

Open a Dev Environment with Codespace

1. **Click the green `Code` button on the repository**

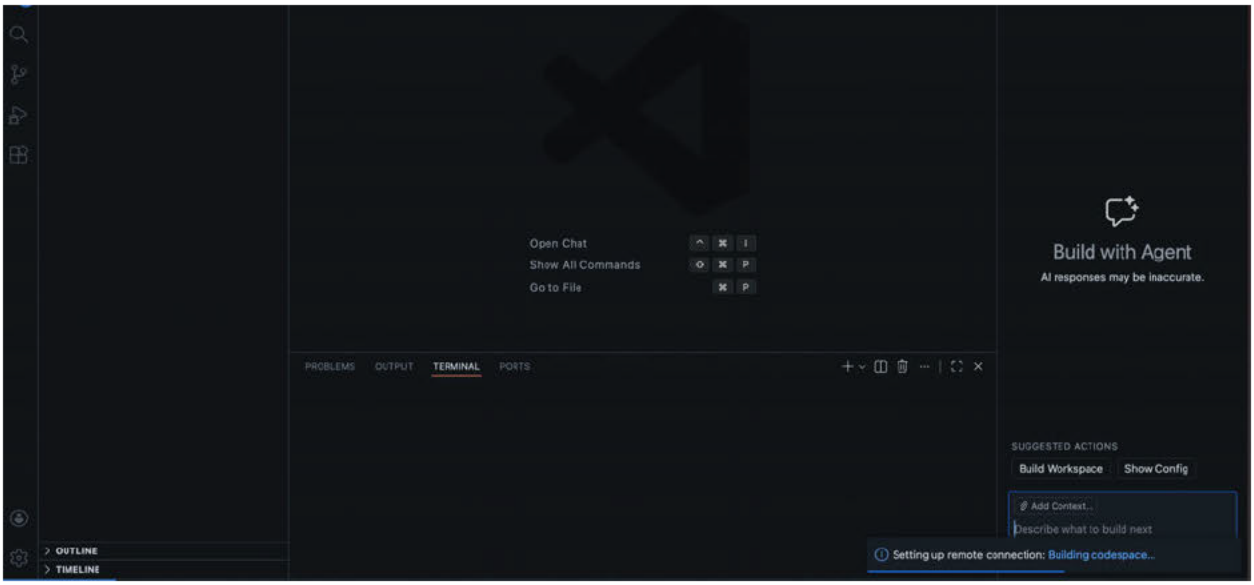

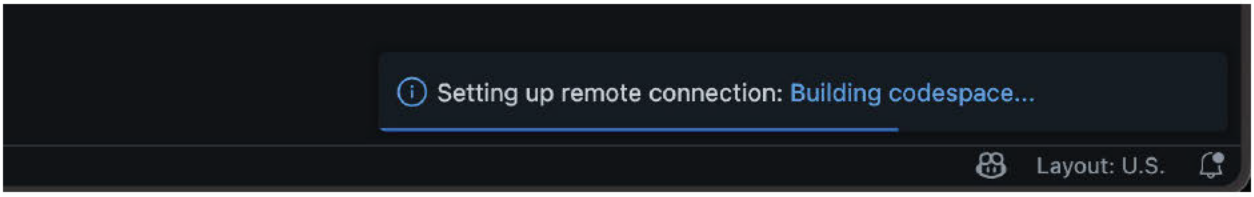

2. **Select the `Codespaces` tab**

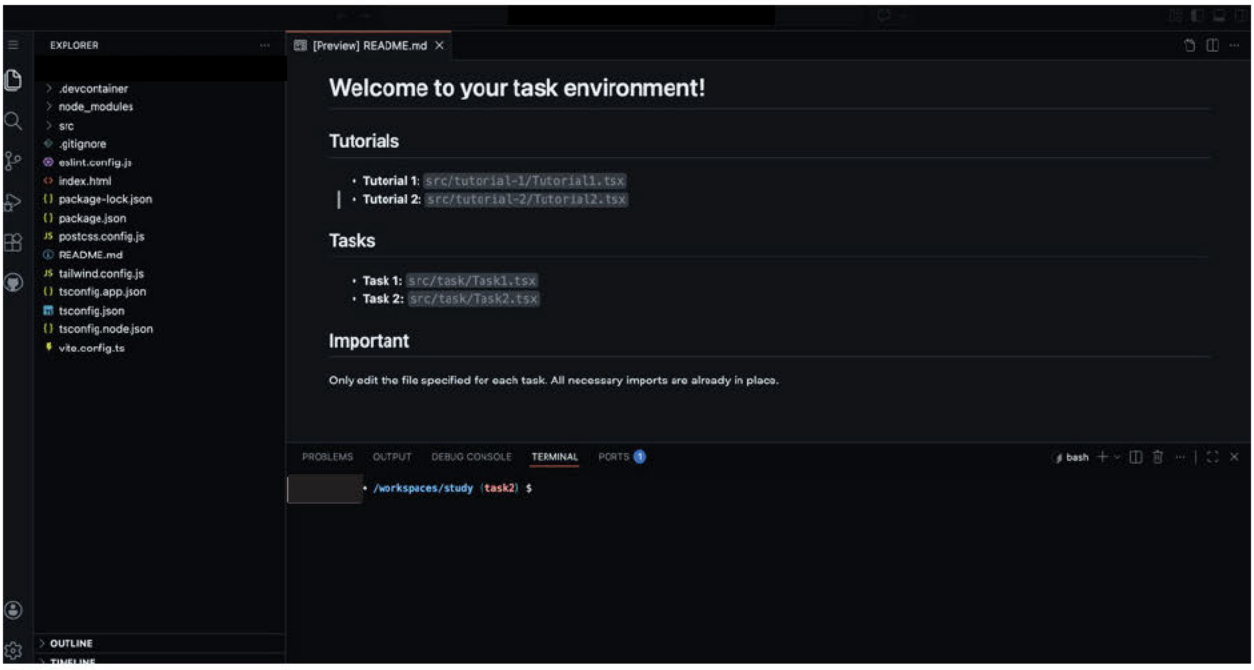

3. **Click the `+` icon button**. Codespaces will launch a new window, where it will set up a development environment and install all dependencies. This may take 1-2

minutes.

2. **Let the set up run until completion.** This is what you should see afterwards.

Running the App

Once your Codespace is ready (you may ask to confirm), open the terminal and run:

```
npm run dev
```

Viewing the App

When the server starts, Codespaces will detect the port and show a **popup notification** in the bottom-right corner. Click `Open in Browser` to view your app. Alternatively, click the `Ports` tab at the bottom of the editor to see all forwarded ports and their URLs.
